Author: Trever Hall
Program: NotQuickbooks (Console Application)
Purpose: Its similar to a simple store inventory tracker that allows you to add, sell, and restock items. Assignment used to get used to using c#.

How to run:
- Start-up: It is preferred to run it directly from the Visual Studio application.
- Input: It will prompt for input from the user throughout the program. To enter input, one would just type when prompted and press enter when done.

Bugs:
The program is very sensitive to input. If the user types the wrong type of input (a string when asking for a number) or presses enter with no input at all then it will cause errors. In most cases it will cause it to crash as well.
